Satellite derived Chl-a

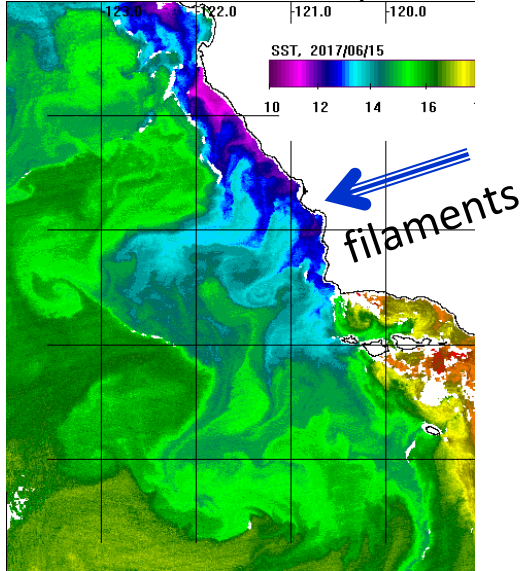

Site News: Cross-shore fluxes associated with upwelling filaments

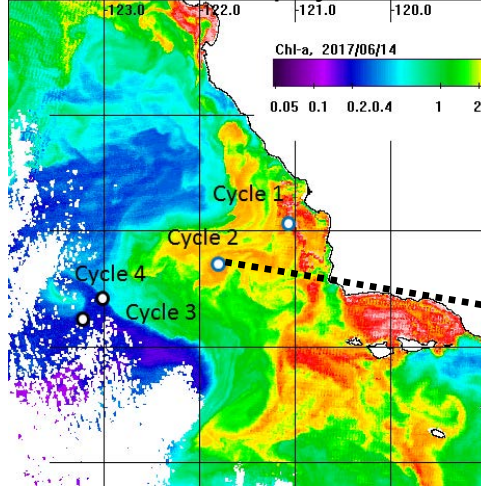

CCE Process Cruise P1706

1 June – 2 July 2017

Sea Surface Temperature

Chlorophyll a

Lagrangian Process Study

(free-drifting autonomous measurements combined w/ shipboard experiments)

Driftarray
(in situ growth, grazing)

Drifting sediment traps

CFE
(C Flux Explorer)

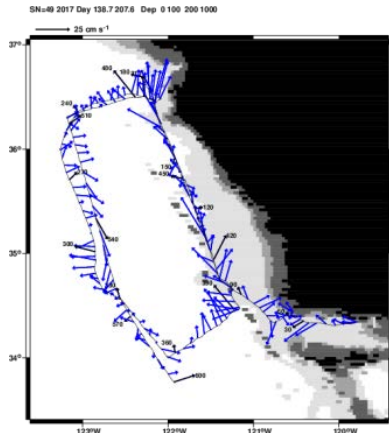

RV Roger Revelle

CF calib
(C Flux calibration)

Autonomous coastal measurements and mesoscale mapping

(gliders and towed profilers)

Spray ocean gliders

Seasoar

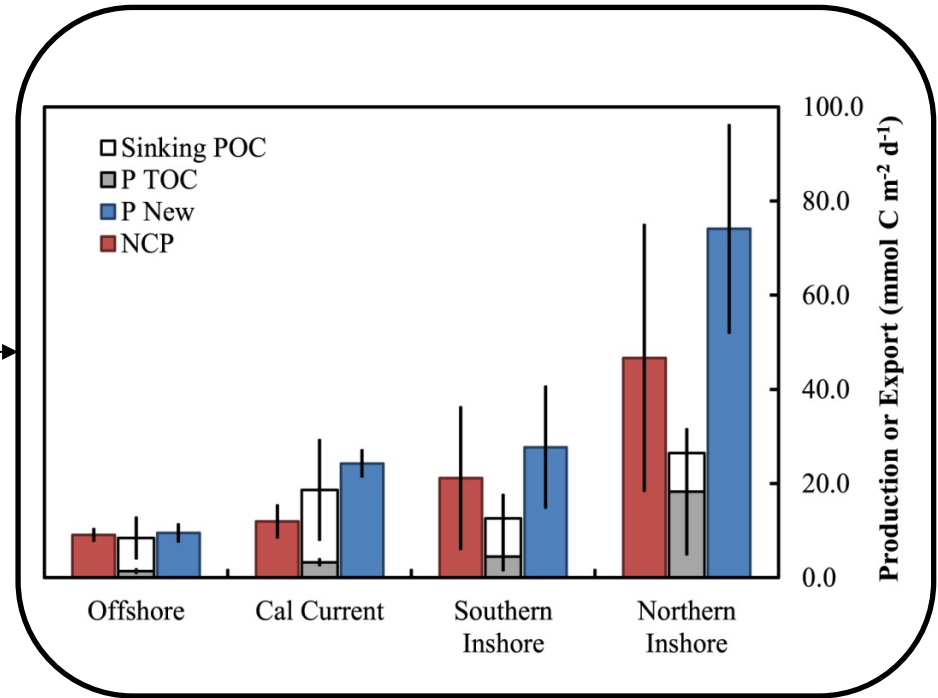

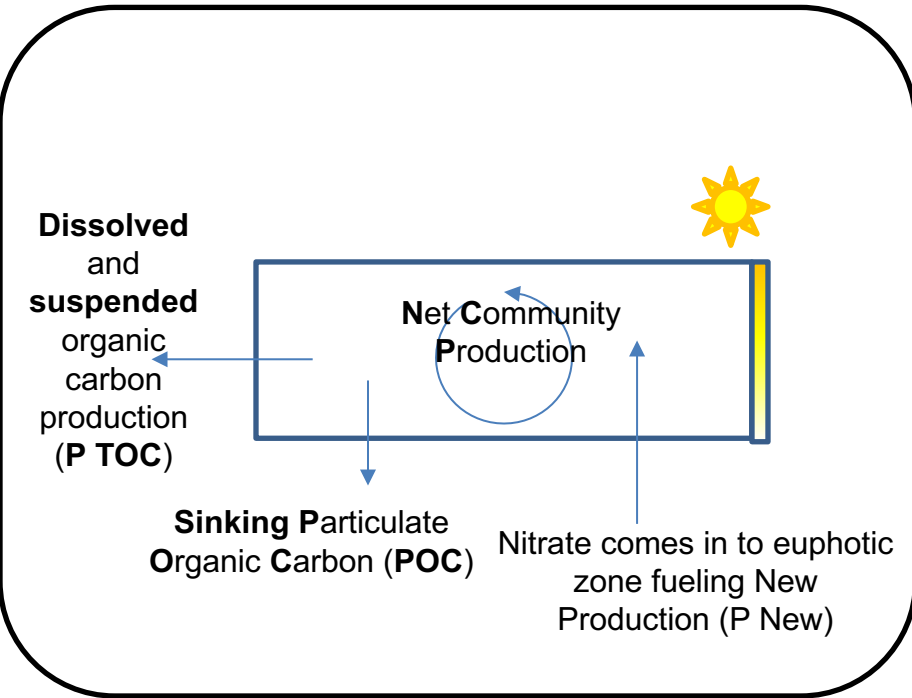

Moving Vessel Profiler

Quantifying exportable organic carbon pools in the CCE

Organic things we do: particulate organic matter (POM) export, dissolved and suspended organic carbon (TOC), FDOM, stable isotopes of OM, environmental (inside and outside cells) metabolomics, active microbial community composition, transcriptomics, OM degradation, OM lateral fluxes etc.

Interannual variability in mean surface PON concentrations in the CCE

PON anomaly relative to interannual (**M**ultivariate **E**NSO Index) and decadal (**N**orth **P**acific **G**yre **O**scillation) climate indices that are relevant for the CCE.

PON anomaly varies with nitrate anomaly at the base of the chlorophyll *a* maximum (data from the CalCOFI program as augmented by the CCE-LTER)
